

Project Title:Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Phase:6 Project Testing Phase

Test Case Execution Matrix

Test ID	Objective	Input Actions	Expected Outcome	Actual Result	Status
TC-001	Item Order Validation	Open Service Catalog -> Hardware -> Click Standard Laptop -> Click "Order Now".	System processes order and returns confirmation page with a valid RITM ticket.	Item successfully checked out. RITM generated.	PASS
TC-002	Flow Triggering System	Check Flow Execution Context Dashboard engine logs immediately after placing the order.	A runtime log context for <code>Standard laptop task</code> shows state as "Completed".	Runtime status verified as "Completed".	PASS
TC-003	Data Payload Integrity	Drill down into the newly created Request Item and navigate to the "Catalog Tasks" related list.	A subtask exists with Assignment Group = "Hardware", Approval = "Approved", and correct Short Description.	All field values verified on the target <code>sc_task</code> record.	PASS

Edge Case & Error Boundary Analysis Matrix

To ensure operational resilience, the development team analyzed system behavior under non-standard runtime conditions:

	EDGE CASE EXCEPTION HANDLING MATRIX
--	-------------------------------------

Anticipated Platform Failure Implemented	Automated Mitigation Strategy
Hardware group record is parent deleted from sys_user_group.	Flow logic defaults tracking back to Service Desk queue to prevent task loss.
User cancels cart checkout instantly; mid-way during processing.	Database transaction rollbacks trigger event drops out of queue safely.
Multiple parallel laptop items processes ordered in single request. row.	Flow engine isolates variables; independent task rows per ordered item
