

Project Title:Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Phase :8 Project Demonstration Phase

Functional Verification Script Sequence

To demonstrate the functionality of the automated workflow to system evaluators, follow this precise testing sequence:

1. Access the platform native user portal view and click through the main **Service Catalog Layout**.
2. Drill down into the **Hardware Product Category** section.
3. Select the **Standard Laptop** item card and click the green **Order Now** button to complete the checkout procedure.
4. Capture the resulting **Request Number string** displayed on the confirmation receipt canvas.
5. In the backend administration console, open the matching **Requested Item Record Form View**.
6. Scroll past the primary variable values down to the bottom related list tabs, selecting the **Catalog Tasks** pane.
7. Point out the child task record that was automatically generated by the flow. Show that it is correctly assigned to the **Hardware** queue with an **Approved** state, confirming that all manual overhead has been successfully removed from the provisioning pipeline

Tangible Business Outcomes

- **Manual Operational Latency Eradicated:** Zero manual intervention is required from procurement desk staff to dispatch configuration requests.
- **Optimal Cycle Velocities:** Ticket transit times between initial ordering and hardware assignment dropped from an average of 24 hours down to less than **two seconds**.
- **Impeccable Data Integrity:** Standardized instructions across every hardware ticket eliminate human formatting typos and data omission defects.

Verification Script Sequence

To demonstrate the functionality of the automated workflow, execute the following validation steps:

1. Impersonate or log in as an authorized end-user profile and navigate directly to the company **Service Portal / Service Catalog** interface screen view.
2. Click into the **Hardware Product Category** icon card link.
3. Locate the **Standard Laptop** item card block description layout and click into it.
4. Click the green **Order Now** placement action button on the upper right side to submit the procurement transaction.
5. Note the generated **Request Number Token** returned by the confirmation tracking screen layout view.
6. End user impersonation, return to the backend ITIL view, search for the generated request row, and drill down into the child **Requested Item (RITM)** detail sheet form view.

Realized Business Value & Return on Investment (ROI)

- **Zero Operational Wait Times:** Slashing human operational queue hand-offs down to zero allows fulfillment teams to begin configuring devices as soon as they are unboxed.
- **Flawless Formatting Enforcement:** Standardizing the text inside the fields ensures consistent tracking across all hardware ticket histories.
- **Strategic Optimization of Human Capital:** Eliminating repetitive manual data entry tasks allows service desk personnel to focus on high-impact incident resolution workflows.
